

The Quick-Hitch M3 without modification of the original bucket can be attached to almost any kind of equipment and completely eliminates the usual long changeover times. It can be fitted to any back-hoe loader and avoids any intervention in the workshop and significantly increases the productivity of the machine.

The Quick-Hitch M3 with modification of the original bucket does neither change the center of gravity of the machine nor alter the load capacity and the breakout force. It is particularly appreciated in tough working conditions, where maximum performance is required by the machine.
